1. Executive Summary

Purpose: This report provides a diagnostic study of how managers at Company X carry out their role as talent leaders. We dove into Division X to uncover their mindset, skills and willingness to manage talent i.e., how they hire, develop, motivate, deploy, and retain talent; and assess the enablers and barriers that shape their effectiveness.

Through in-depth interviews across leadership, middle management, and human resources, the following were observed:

Key Findings: Insights, Systemic Risks and Misalignments

- **Talent practices are inconsistent and overly dependent on individual managers:** TA lacks technical screening capability so managers step in; inconsistencies due to unavailability of set user friendly tools/processes; expectations vary by leader; mobility depends on manager relationships rather than system design.
- **Lack of clarity across the talent lifecycle:** Employees don't know what great performance looks like; promotions, bonuses criteria unclear for employees; and HiPo criteria differ by leader.
- **Over-reliance on intrinsic motivation weakens retention:** The organization cannot compete financially in hot talent markets so leaders rely on meaning, relationships, and mobility; limited financial levers and no mid-level succession make high-impact roles vulnerable to external pull.
- **Long-term capability is at risk:** Deployment is strong today; lack of formal critical-role mapping and lack of succession planning below director level create fragile mid-level pipelines and expose the organization to future capability gaps; relationship-driven mobility could risk scaling.
- **HR tools are early-stage and underused, limiting HR's ability to be a strategic partner:** No shared HiPo criteria forces managers to rely on intuition; early-stage processes/tools contribute to low adoption and hence inconsistent decisions in the business; no visibility into critical roles limits HR's ability to support strategically.

Implications: The organization's current talent system relies heavily on managerial heroics, not organizational consistency. This creates inconsistency across the nine MBN actions and limits the company's ability to raise the quality of talent (**More**), grow talent systematically (**Better**), Build future-ready talent pipelines (**Now**).

Recommendations:

- Strengthen HR capability and establish usable processes so they can support the business at a strategic level
- Enable and encourage managers to provide explicit clarity to employees around expectations, promotions, and bonuses
- Build joint succession and pipeline planning especially at the mid-level to strengthen long term capability of the organization.

2. Introduction

Organization X's Division X operates at the intersection of creativity, engineering, and advanced research. The division's work spans across AI/ML, robotics, R&D prototyping, and immersive experiences - domains that need very niche, highly skilled individuals. In this environment, as highlighted by all the interview participants, talent has disproportionate impact i.e., a few individuals drive larger value to the business. Additionally, performance for this division is multifaceted i.e., behaviors, values, ethics, commitment matter as much as driving results. Hence the leaders wish to invest in the 'rare and elite' talent to meaningfully advance the business. (Organization's Talent Philosophy - *See Exhibit 1*)

Because of this high-talent-leverage context, managers play an important role in shaping talent outcomes. They are responsible for hiring, identifying potential, driving and evaluating performance, developing capability, retaining key people, and deploying talent across dynamic project needs. (*See Exhibit 2* for overall talent management strategy)

Therefore, this study examines how the leaders and managers understand and enact their talent management responsibilities, what enables or constrains their effectiveness, and how their practices align with the More-Better-Now framework. By analyzing these elements, the report identifies patterns, misalignments, and systemic risks that shape the organization's ability to attract, grow, retain, and deploy high-impact talent.

3. Methodology

We conducted four in-depth, semi-structured interviews representing critical organizational layers:

- **Two Directors** (referred as leaders in the report) responsible for majority of talent decisions
- **One Middle Manager** (referred as manager in the report) who help execute talent practices day-to-day and also brought the perspective of employees
- **One Senior HR Business Partner** who supports the business in execution of talent management processes

The triangulated view allowed us to cross validate leadership, managerial, HR and employee perspectives giving us insights into how talent is understood, acted upon, and experienced across levels while also revealing the inconsistencies.

All interview insights were analyzed using the nine elements of the More-Better-Now framework. This framework allowed us to identify systemic risks and misalignments across the talent lifecycle.

Limitations: Given the small sample size, our findings cover depth over breadth, consistent with the project expectation option A (deep-dive design). The interview data captured is self-reported and hence the responses may be influenced by perception biases, but triangulation mitigates this to a meaningful degree.

4. Findings

Talent management encompasses the process of planning and shaping the progression of individuals within the organization according to several aspects: the organization's goals, the employees performance and potential, and the individual goals and preferences. Successful talent management includes *getting more high-performing talent than competitors*, *getting more from the talent currently possessed*, and *creating movement of the talent where it matters most* to create value for the organization. These are the main three aspects of the *More.Better.Now* framework that will be used to analyze the managers talent management mindsets in Division X.

4.1 More - Hire Well

In order to obtain more high-performing talent than competitors, the organization must hire well. Currently hiring practices are extremely manager driven rather than HR or Talent Acquisition (TA) driven. The recruiters conduct the initial sourcing then the middle managers act as the main filter then the directors focus more on the assessment of “culture fit.”

Manager and Directors described the overreliance to compensate for the TA's inability to identify qualified candidates. The middle manager explained that “it takes four to five months before recruiters understand what I’m looking for.” This time delay could be a serious problem as strong candidates accept offers elsewhere during this lag, but does show that recruitment prioritizes quality over speed.

Director 1 echoes this, stating that recruiters misjudge both technical and cultural fit and managers often need to “hold the line” on standards themselves, to ensure quality.

Each of them articulated clearly what they look for when hiring. First, evidence of capability, not just verbal performance is the baseline of a good candidate. Director 1 only trusts tangible portfolios with real work and Director 2 rejects “idea people,” instead desiring “builders.” The middle managers believe that the TA cannot screen efficiently so they must initially evaluate and validate the technical skill levels. Culture and collaboration is a critical filter as well, and all reject people who cannot work well with others. They express that their environment is constantly shifting due to organizational structure changes, AI, innovation therefore adaptability is a requirement. The middle manager as well as senior managers assess in terms of preferences or “fit,” behavioral competence and technical skills (see *Exhibit 3*).

The problem is being able to translate this into clear criteria for TA to be able to screen and identify the best candidates, reducing delays and misunderstandings. Underlying these hiring practices is a shared managerial belief that talent in this specific environment is rare, deeply contextual and can only be identified through their judgement. The TA capabilities do not match their expectations and this is why they assume personal responsibility for defining the bar.

Drive Performance

The core misalignment we identified within *Drive Performance* was the disconnect between perceptions of “success” for the employee. The leaders believe that they set clear expectations but the employee may experience uncertainty and inconsistency about what success actually means. Both leaders believe that they provide strong clarity and direction.

Director 1 states that “the work speaks for itself...I give direction by shaping big problems,” with the expectation that the employees will naturally “rise” to the challenge. Director 2 describes how “success is defined by outcomes and team trust, and I feel I communicate those clearly.” They evaluate success by whether the team wants to work with the individual again, but neither clarifies the balance between “how” vs. “what.” This is intuitive and while may seem clear to the leaders themselves, it can be interpreted differently than intended.

The middle manager confirmed this misalignment stating that the employees rely heavily on translation from middle managers to decode the leadership’s intent and to “tell the success stories upward.” The two mental models do not match as managers believe performance expectations are communicated through ambitious assignments and team context. On the other side, the employees experience ambiguity and lack of explicit criteria, resulting in necessary middle managers translation.

When driving performance, the managers consistently provide feedback, while informal, employees have one-on-ones constantly for feedback. The leaders and managers expressed how they do give bad feedback when necessary, and praise when deserved with the employee perspective matching the overall productive feedback culture. (*See Exhibit 4* to understand the critical elements of the existing Performance Management System)

Retain the Best

Both directors believe they actively work to retain their best people through personalized, relationship-based, informal methods. Despite manager effort, all interviews revealed where the manager's beliefs break down in practice: salary gaps.

“[Organization X] structurally relies on intrinsic motivation because compensation is below market.”

The leaders acknowledge that this salary gap is a problem, but is one that cannot be solved. Instead, Director 1 compensates with stretch assignments that are high-value and intellectually challenging projects “you’re solving problems nobody else can” reinforcing their importance through recognition and visibility. They tried to respond with spot bonuses when possible but heavily relies on personalization, meaningful work and autonomy as the retention lever for key employees. Similarly, Director 2 has ongoing open conversations about frustration, burnout, joy and career directions to understand what personally motivates or demotivates each individual then tries to increase the amount of motivational work. Both are actively fostering personal transparency and relationships so they can proactively track flight risks and sense dissatisfaction then take action.

For *Critical-Capacity Retention*, the leaders understand the critical individuals and utilize spot bonuses or role adjustments to keep them. HR has limited visibility into the managers criteria for “critical individuals” so this is very leader-driven rather than system-driven. For *Regretted Attrition*, the directors do conduct exit interviews and actively use mobility and diagonal promotion to retain their employees. For *Market-Driven Retention*, the company has allocated limited resources to counter the external offers. Even though it is a challenge to compete with drastically different salaries from competitors, the leaders are actively combating this.

4.2 Better - Realize Potential

In order to “realize potential” it is important to understand the definition of “high potential (HiPo).” Each leader defines this differently from each other and from HR. For Director 1, HiPo employees are the ones who can adapt, think broadly, and cross-disciplinary with signs of potential being “big-picture or cognitive ability.”

“The very unique value that people provide are folks who can think across disciplines and conceptualize problems completely differently and pull conflicting ideas together in ways that are not natural for most people” - Director 1

Comparatively, Director 2’s HiPo signal is socially and team driven, not only individual performance. They believe these individuals show HiPo when “everyone wants to work with them,” and they take on more responsibility naturally, adapting as priorities shift.

The middle manager grounded their definition in performance rather than abstraction, basing HiPo on consistent, high-quality execution. The similarities between leaders are adaptability and conceptual thinking, but the middle managers and employees value execution over abstraction. When discussing this point with Director 1, they stated that the execution is baseline, and this is an expectation for basic performance, and HiPo comes from the broader thinking but it is assumed that “they can execute the vision.”

Both directors define HiPo in terms of *leadership potential*, but the middle managers and employees definitions are more *general potential* and “*protential*.”

HR systems in place to identify HiPo are more for high performance, not actually potential. Their performance ratings are being mixed with talent or potential assessments. As HR explained, to identify HiPo, they have recently introduced a structured rating and scoring system where employees are evaluated using a 1-5 rating scale across six defined dimensions. Each category is calibrated across leadership levels to create a numerical score flagging the high performers for bonuses. While high potential individuals are almost always high performers, this doesn’t mean that all high performers are high potential. This is a distinction that is not currently being made or recognized. As a result, HR’s structured scoring system collides with manager intuition producing a model where potential is simultaneously “measured” and subjectively interpreted.

Directors have solid definitions of high potential and are actively placing those individuals in stretch assignments to test readiness but both stated that they do not promote before they are fully ready due to the risk aversion nature of projects and the organization. The different definitions and understanding of high potential across groups creates room for misunderstandings and the inability for HR to support the managers in the management of the high potentials.

Develop Deliberately

The directors believe talent is rare and exponentially valuable which leads them to place emphasis on developing who they identify as high performers. Both do so through stretch and discomfort, putting people in situations where they have to face hard problems and new responsibilities. They both view development as embedded in “real work” not specific programs which are aligned with the 70/20/10 philosophy.

HR has introduced career frameworks that illustrate level-based descriptions of skills, behaviors and contributions intended to give a clearer map of what development looks like. The middle managers flag this as a systemic risk as “people immediately try to treat frameworks as

checklists for promotion” and the organization has “cultural aversion to explicit advancement criteria” for fear of legal exposure and overpromising.

These HR tools could support the directors in having conversations about consistent development but they’re held back from making it fully explicit. This results in half-clarity and highlights development as manager-dependent not system development.

Motivate Meaningfully

As previously mentioned in the *retention* section, working with limited salary resources, Director 1 believes motivation through challenging work, trust and recognition not systemic rewards:

“We don’t have the comp to balance it...you have to feed the ego with meaningful problems.”

Director 2 invests in understanding what energizes each individual by charting “what lit you up” vs. “what made you think ‘I can’t do this.’” They then guide people through the demotivation, confusion and personal doubt. While the personal, emotional aspect plays a large role in motivation, the tangible motivational factors like bonuses and promotions are unclear. The middle manager noted that they “didn’t know bonuses were tied to performance for nine years.” The high performers may be rewarded but they don’t know it. Promotion rules are still not transparent as the company attempts to avoid grievances so overall the company relies heavily on intrinsic motivation or culture, mission, creativity and impact.

Both directors place less emphasis on systems, promotion and bonuses to motivate critical talent, instead focusing on intrinsic challenge and emotional fulfillment. However, these critical motivational mechanisms remain invisible to employees. Due to the managers' belief around primary drivers, they unconsciously underweight the importance of transparent, structural motivators that leave the employees unclear how performance translates into rewards.

4.3 Now - Know Your Critical Roles

There is no formal mapping of critical roles. The directors have clear personal models of who is “critical,” but this understanding lives solely in their minds. These crucial individuals are categorized by the leaders' descriptions of high performers: high technical abilities, broader vision, cross-functional, collaborative and adaptable. The criticality is based on an intuitive understanding of where value is created, and HR has no visibility into this which widens disconnect between talent systems and manager execution. The HRBP admits that HR does not possess the technical understanding that would be needed to map role criticality, but this means they need to rely on directors and managers to supply insight. It is hard for them to externalize it, therefore the valued role identification is informal and inconsistent. If the leaders left, the system would not know who the critical people are or why.

The result is a fragile system with critical-role knowledge being personalized rather than institutionalized.

Building Pipelines

Director 1 doesn't think in terms of formal pipelines or successor lists but instead of trajectory and capability. They identify people who "bubble up" then stretch them into discomfort to conceptualize bigger problems and place them onto progressively harder projects to test readiness but do not explicitly write succession plans. Likewise, Director 2 sees pipelines and emergent leadership through observing project work and focuses on development and development but doesn't translate into succession documents. The employee perspective confirms that there are no formal pipelines. Pipeline health becomes a by-product of manager attention instead of strategic process.

Play the Chessboard

While there are no structured pipelines, there is frequent diagonal mobility. The department and organization as a whole has cultivated a supportive culture of talent mobility. Movement across projects, teams and even disciplines is accepted and encouraged by managers. Both directors explain that the department is highly matricized and frequently share talent across their teams. There are no rigid team boundaries:

"[Director 2] and I have always sort of shared resources across projects...most of the projects that are led under my organization I have at least a handful of folks from [their] group as well that have complementary skills" - Director 1

The movement is very organic and driven by where someone can add the most value based on emerging needs and individual strengths. The middle manager reinforces that diagonal mobility is often the primary pathway for growth. They note that these managers support employees moving into new roles even if it means losing strong performers. Due to limited growth roles within the department, if one is open elsewhere the movement is supported.

The culture of fluid mobility, supported by the managers, reflects the belief that people should go where they can add most value and grow the fastest, fostering the environment for movement.

5. Insights

5.1 Talent practices are inconsistent and overly dependent on individual managers

The organization's talent system relies heavily on managerial judgment rather than organizational systems. Hiring, development, performance evaluation, recognition, and mobility work differently depending on the leader, not the system. Leaders create high-quality talent experiences through strong instincts, but these are not supported by scalable processes. Middle managers compensate for system gaps by taking on recruiting work, clarifying expectations, documenting progress, and translating leadership messages. As execution heavily depends on managers, the system cannot deliver consistent outcomes and scale beyond the manager.

5.2 Lack of clarity emerges as a blocker across the talent lifecycle

Ambiguity is present in - expectations, performance standards, promotion logic, bonus criteria, development paths, and even the definition of high potential. Leaders believe they communicate clearly, but employees report uncertainty. This is magnified by inconsistent use of HR frameworks or tools. Without clarity, even strong managers cannot drive performance or

development consistently making “Drive Performance” and “Develop Deliberately” difficult to execute.

5.3 Over-reliance on intrinsic motivation weakens retention, especially in high-impact technical roles

The organization's motivation and retention levers are prone to weaken. Its culture and financial capability make the division heavily rely on intrinsic motivation and strong manager-employee relationship which is insufficient for market-driven retention in scarce skill areas. While internal mobility and diagonal promotions help, lack of active succession below the director level increases vulnerability to external pull. The organization's individualized retention approach builds loyalty but lacks the structured or financial mechanisms needed to retain scarce technical talent in a competitive labor market.

5.4 Long-term capability at risk

The organization excels at talent deployment today. But given heavy reliance on manager relationships for talent mobility and a weak mid-level pipeline we observe that the division is not preparing for the future, exposing the organization to future capability risk. Additionally, HR's support is very limited given limited visibility. The organization's “Now” system supports short-term agility but not long-term capability.

5.5 HR tools/processes are early-stage and underused, limiting HR's ability to act as a strategic partner

Processes and tools are taking shape but are still in a very immature state. As the function is making progress and providing business with tools and processes, they believe they are providing strong support but without utilizing the tools, they can't be helpful. HR's early-stage tools and limited visibility prevent it from functioning as a strategic partner in talent decisions. As shown in *Exhibit 5*, managers perceive the division as facing high transformation barriers around talent attraction and skills gaps, this emphasizes the need for HR to mature into a strategic partner.

6. Recommendations

The recommendations below target three leverage points on how the organization and HR can better equip managers to lead talent effectively based on the analysis above: (1) HR capability and processes, (2) clarity toward employees, and (3) shared succession pipeline between HR and managers.

The critical players for talent management can be mapped onto Joss, McDonnell & Skuza's model: The senior leaders and directors are currently acting as “The Captains”, with high strategic and organizational focus. Middle managers are “The Connectors” with more of a tactical focus and HR is “The Bystander.” Unaligned with the label for HR, they show commitment and want to help but the execution and misalignments are creating inefficiencies and limitations to help the managers. By implementing processes and opening communication between the managers and HR, they can play a larger role in the strategic aspect of talent management, moving into the role of “The Captain.” (See *Exhibit 6*)

6.1 Strengthen HR Capability and Establish Usable Processes

The division operates in AI/ML, robotics and creative engineering which are domains where talent is rare, holistic, and deeply contextual. HR cannot meaningfully support managers without a baseline understanding; therefore, it is crucial to build technical and role-specific understandings within HR and TA.

Actions

- Deliver technical literacy training for HR and TA.
- Co-create technical hiring rubrics with managers to ensure TA screens for correct capabilities from the start.
- Facilitate calibration workshops where managers can clearly define “what great looks like” for each role.

Outcome: HR and TA improve the speed, accuracy and quality of hiring to reduce managers compensatory labor.

Current HR processes are still in early stages and are inconsistently applied. HR must provide managers with user centric and intuitive tools, structure and repeatable processes that turn instincts into articulated, consistent criteria to solve the absence of shared language and criteria for high potential and critical roles.

Actions

- Introduce separate HiPo framework and talent review sessions separate from performance reviews (ex: 9 box).
- Create a critical-role scoring tool so managers can identify criticals consistently and transparently.
- Conduct quarterly HR refresh sessions to reintroduce tools and processes.

Outcome: Clear, shared definitions of potential and criticality allow the organization to make aligned, data-informed talent decisions. Consistency across managers and higher adoption of the HR processes and tools.

Overall, the increased capabilities and processes of HR to make hiring more efficient, and help in translating managers mindsets into tangible definitions allows HR to take on the role of a strategic partner in talent management rather than just a process administrator.

6.2 Enable and Encourage Managers to Provide Explicit Clarity to Employees

Lack of clarity is a consistent theme from the employees point of view: around expectations, performance standards, success criteria, promotion logic, and bonus criteria. While the organization and HR has fears of potential repercussions through the formalization of success criteria, clearly communicating that these are not “checklists” for promotion or advancement, mitigates this risk.

Actions

- HR and managers co-create open-ended success profiles including: key outputs, behaviors + collaboration expectations, technical + contextual capability requirements

with indicators of high performance.

- Use these profiles in goal-setting, feedback and career discussions without making promises.
- Train managers in balanced, actionable, bias-aware feedback.

Outcome: Employees understand what success looks like and managers have a common language for evaluation and development.

6.3 Build Joint Succession and Pipeline Planning

Currently succession is informal, intuitive and concentrated only at the director level. To reduce organizational risk and give HR visibility, succession must become shared between HR and managers.

Actions

- Map critical roles and skills together (HR and managers) to create a shared view of where capability risk is highest.
- Create development pathways for successors.

Outcome: Pipelines shift from being subjective and limited to manager judgement to transparent and system driven. Critical roles are understood, successors can be intentionally developed and the division becomes more sustainable for the future.

7. Conclusion

Exhibit 7 summarizes our analysis and patterns well. Our own assessment places the division into a “solid but fragile” middle in the *More.Better.Now* framework with mostly 3s, stronger practices around retaining and motivating key people (4s), and clear strength in talent mobility (5). Although the *Now* dimension exposes structural risks where the organization does not have structured understanding of critical roles (2) and no formal pipeline (1). To sum up, the division is good at using the talent today, but under-invests in the systems needed to secure tomorrow.

The self-perception grids underline why these gaps persist as leaders and managers consistently rate themselves higher across most actions than HR and employees. All three groups agree that talent mobility is a relative strength and that mapping critical roles formally (so HR also has the visibility) and building pipelines are weak points; however, they disagree on how well performance, development and motivation are actually being delivered. This misalignment between leader/managerial intent and employee/HR experience is the gap that the recommendations aim to close. If the division can (1) strengthen HR capability and processes, (2) give clarity toward employees, and (3) build shared succession pipeline between HR and managers, the organization can benefit from *getting more high-performing talent than competitors, getting more from the talent currently possessed, and creating movement of the talent where it matters most.*

8. Appendices

Exhibit 1: Organization's Talent Philosophy

Talent Differentiation Spectrum

Performance Spectrum

Context Spectrum

Note: For the organization, talent is highly exclusive, heavily context-dependent and performance is multifaceted.

Exhibit 2: Overall picture of Organization X-Division X's Talent Management

Exhibit 3: What do the directors typically assess for?

Preferences

- Intrinsic motivation for hard, ambiguous problems
- Comfort with constant change (AI shifts, re organization, ambiguity)
- alignment with creative-technical mission + values

Technical

- Demonstrated hands-on capability
- Depth in AI/ML, robotics, engineering (depends on role)
- Strong problem solving
- Ability to connect ideas across domains

Behavioral Competence

- Strong collaboration and "people want to work with them again"
- Adaptability
- Team/collaboration mindset
- Accountability and ownership

Performance

- Combination of all aspects
- Consistency high-quality execution (baseline expectation)
- Demonstrated ability to raise quality of team output

Exhibit 4: Performance Management System at Organization X, Division X

Element	Design Choice	Organization X's choice
Goal Setting	Degree of Differentiation	Multiple Systems
	Nucleus of Performance	Priority focus on teams
Performance Reviews	Performance Formula	Shared focus on business outcomes and employee behaviours
	Review Responsibility	Manager-led reviews
Ongoing Development	Levers for Development	Combination of past performance and individual growth needs
Rewards	Incentives	strong focus on non monetary incentives

Goal setting: Goals are adapted as per the teams and a strong emphasis is placed on the project teams in determining success and performance evaluation.

Performance Reviews: Performance at organization X is what the team or the individual accomplishes and how (collaboration, communication, adaptability etc) they accomplish the same. And these reviews are led by the managers.

Development levers: For employee development, the organization utilizes both past performance and individual growth areas. Heavy investment is made on filling the skill gaps of top performers and high potentials.

Rewards: Given the organization cannot compete with the big tech firms on compensation, there is a strong focus on non monetary incentives like recognition, development opportunities and career progression.

Exhibit 5: Barriers to Organizational Transformation (World Economic Forum vs. Division X)

Exhibit 6: Mapping of Directors, Middle Managers & HR

	TACTICAL	STRATEGIC
ORGANIZATIONAL FOCUS	<i>The Connector</i> Middle Managers Engages in talent sharing across functions but has limited commitment to the organization's talent strategy; invests relatively little in talent identification and development.	<i>The Captain</i> Directors/Managers Demonstrates strong commitment to the organization's talent strategy; leads talent identification, development, and sharing within their team and across the organization.
TEAM FOCUS	<i>The Bystander</i> HR Shows little commitment to the organization's talent strategy and/or may not have sufficient resources to engage in talent identification, development, and sharing.	<i>The Protector</i> Engages in talent hoarding within their team; sees the benefits of a talent strategy and engages in talent identification and development but is unwilling to share talent.

Exhibit 7: *More.Better.Now.* Ratings**More.Better.Now Ratings**

Scale of 1-5 (1 = not performing well, 5 = great performance with no improvement needed)

Our Analysis

MORE <i>hire well</i> 3	BETTER <i>realize potential</i> 3	NOW <i>know critical roles</i> 2
<i>drive performance</i> 3	<i>develop deliberately</i> 3	<i>build pipeline</i> 1
<i>retain the best</i> 4	<i>motivate meaningfully</i> 4	<i>play the chessboard</i> 5
